

After the Elections: What matters for German policymakers in the EU's energy package

Project

Duration

Sep 2017

[View Publication](#)

The EU is currently negotiating a comprehensive reorientation of energy and climate policy for the decade 2020-2030. Ecologic Institute drafted a strategy paper on how the next German federal government can shape the EU negotiations so as to create an EU electricity market regulation that is conducive to the German energy transition. Four central elements are identified: raising the ambition of energy targets and introducing long-term targets, developing effective oversight instruments to ensure compliance, adjusting the electricity market to the needs of wind and solar power, and initiating an exit strategy for coal firing. The paper is available for download.
