"Latin America and the Caribbean; A Biodiversity Superpower" is an initiative of the United Nations Development Programme (UNDP). Marlon Flores, Senior Policy Advisor at Ecologic Institute, contributed the chapter on "Protected Areas" to the initiative's report "Importance of Biodiversity and Ecosystems in Economic Growth and Equity in Latin America and the Caribbean: An Economic Valuation of Ecosystems".

The Latin American and Caribbean region has one of the greatest endowments of natural capital in the world, which is a source of economic growth and has the potential to become the world leader in offering the services its ecosystems and biodiversity provide, and in return receive new benefits from this conservation and sustainable management. The new policies recommended in the publication promise to transform the traditional model of development — one that often disregards environmental costs —
into a new paradigm that recognises the value of services provided by healthy, fully functioning ecosystems.

The Report aims to inform policy makers and businesses in the Latin American and Caribbean region about the economic risks and opportunities of undertaking productive activities that impact on and are influenced by biodiversity and ecosystem services. The Report is a tool to assist governments and stakeholders in analyzing the role of ecosystem services in order to incorporate these services into economic planning, policy and investment at the sectoral level.

In his chapter on "Protected Areas" [2], Marlon Flores, Senior Policy Advisor of Ecologic Institute, assesses the evidence on the contribution of Protected Areas to the wider economy and contrasts this against the current status of financing for Protected Areas in Latin America and Caribbean.

Protected Areas have cross-cutting effects. They contribute to the economies of Latin American and Caribbean countries through each of the other sectors reviewed in the book: agriculture, fisheries, forestry, tourism, and hydrological services. Marlon Flores' chapter relates the varied functions of Protected Areas and of the ecosystem services they support to productive processes in each of those sectors. The chapter also compares the effects of contrasting management regimes — from not managed to minimally-managed and well-managed — on the cross-cutting contributions of Protected Areas.

The chapter illustrates how Protected Areas contribute to sustain ecosystem services and examines the potential decline in productivity due to the degradation of ecosystems as a consequence of under-investment in Protected Areas. To this end, three scenarios are considered: a “not protected” scenario, in which habitats are not safeguarded and, thus, likely to be degraded; a “business as usual” scenario, where basic Protected Area protection is available but can mitigate only low level threats; and a “sustainable ecosystems management” scenario, with sufficient funding to support comprehensive, cost-effective Protected Area system management plans. In the case of sustainable ecosystems management, threats are fully managed (mitigated), and new business opportunities may be created in areas like eco-certification, sustainable sourcing, and novel ecosystem services.

Growing evidence indicates that the economic benefits of well-managed Protected Areas are multiple: increased production (GDP) in selected sectors, more jobs in rural areas, higher tax revenues, and higher foreign exchange earnings, especially through international tourism. Additional sectors can be affected as a result of economic ripple or multiplier effects.

This initiative has been sponsored by UNDP in partnership with the
UN Environment Programme (UNEP), The Economic Commission for Latin America and the Caribbean (ECLAC), the Secretariat of the Convention on Biological Diversity (CBD Secretariat) and the UN Conference on Trade and Development (UNCTAD), and with the generous support from the government of Spain.

Table of Contents

10.1 Introduction
   Key findings
10.2 Context of Protected Areas
   Protected Areas
   Threats to Protected Areas
   Insufficient Funding to Cover the Costs of PA Management
10.3 BAU and SEM in Protected Areas
   Defining BAU and SEM
   Differences in the BAU and SEM management approaches
10.4 Importance of Protected Areas to Growth: Benefits and Costs under BAU and SEM
   Agriculture
   Irrigation
   Wild Genetic Resources
   Fisheries
   Forests
   Trade-offs between BAU and SEM in Forrest Resource Management
   Reduction of Deforestation
Forest Concessions and Taxes
Carbon Storage
Nature-based Tourism
Job Creation and Income
Tax Revenues
Foreign Exchange Earnings
The Multiplier Effect of NBT
Financing to PAS
Private PAS
Negative Impacts of Tourism (BAU Practices)
Human Settlements (Potable Water, Disaster Mitigation, Hydropower)
Drinkable Water
Disaster Mitigation and Prevention
Hydropower
10.5 Importance of Protected Areas to Equity and Poverty Reduction
Economic Benefits
Political and Social Benefits
Are PA Objective Compatible with Poverty Reduction
10.6 Conclusions and Recommendations
Conclusions
The Transition from BAU to SEM is feasible
Barriers to the Transition from BAU to SEM for PAs Are Significant
Growing Biodiversity and Ecosystems Markets Can Provide Significant Benefits to Business
PAs Drive Foreign Exchange Earnings and Local Employment. Especially via Tourism
The Benefits of PAs Are not Equally Distributed
PAs under SEM Can Contribute to Equity and Poverty Alleviation
Economic Benefits from PAs and Cost Reductions from SEM Justify Including Externalities
SEM Secures High Quality and Quantity of Water Resources from PAs. Indispensable to Maintaining Production Levels and Savings in Irrigated Agriculture, Hydropower and Potable Water
Hydropower: SEM Can Secure Sufficient Water Flow and Savings (Avoided Replacement Costs) in Hydropower Dam Operations
Marine and Freshwater Protected Areas Contribute to Growth Through Biodiversity Conservation
Recommendations
Research and Information Management
PA Policy and Finance
Institutional (Public and Private)
Annexes
Annex 10.1. Threats to Freshwater Ecosystems and the Possibility of Prevention by Protected Areas
Annex 10.2. PAs and Crop Genetic Diversity in Selected LAC Countries
Annex 10.3. IUCN Protected Area Management Categories

Keywords
Protected Areas, PA Management, BAU, SEM, Agriculture, Irrigation, Wild Genetic Resources, Fisheries, Forests, Deforestation, Taxes, Carbon Storage, nature-based
Tourism, Job Creation, Income, Tax Revenues, Multiplier Effect, NBT, PAS, Tourism, Human Settlements, Potable Water, Disaster Mitigation, Hydropower, Drinkable Water, Mitigation, Poverty, Benefits,
