

# A review of current practice in integrated ecosystem assessments and summary of best practice recommendations using three case studies

Susanne Altvater,  
Katriona McGlade,  
Franziska Stuke  
Elena von Sperber

Ecologic Institute

## Outline

- ▶ Aim of the study
- ▶ Methodology
- ▶ Results

## Aim of the study

- ▶ For the German Environmental Protection Agency (UBA; observer: U. Claussen, V. Leujak), finished Nov 2011
- ▶ Political requirements within the MSFD
- ▶ Questions:
  - ▶ Which obligations have to be fulfilled by a comprehensive assessment concept?
  - ▶ Which aspects of the WFD assessment process could be applied?
- ▶ Aim: comprehensive overview of the up to date knowledge regarding IEAs

# Methodology

- ▶ Three groups of sources:
  - ▶ Scientific literature
  - ▶ Integrated assessment reports / fully integrated assessments
  - ▶ Expert interviews
- ▶ Selection of case studies and factsheets

## Central questions

- ▶ What management approach does the assessment take?
- ▶ Which (biological quality) components are addressed in the assessment?
- ▶ Which anthropogenic pressures are included?
- ▶ How are the biological characteristics and human pressures integrated into one overall status assessment?
- ▶ Are cumulative effects taken into consideration and if so, how?

# 1. Step: Desk Study

- ▶ Assessment of Scientific Literature
  - ▶ Ecosystem Approach/Integrated Ecosystem Assessment
  - ▶ Review of Working Groups (WGECO, ICES; Assessment of Assessments; European Marine Monitoring and Assessment; MSFD Management Group; SEAMBOR)
  - ▶ Review of tools (Decision-Trees, Risk-Analysis..)

## 2. Step: Interviews

- Conducting 12 interviews with practitioners (e.g. from Spain, Portugal, Canada, Australia, US)
- Task: additional information on the background and the implementation of IEAs worldwide
- Helpful for:
  - The selection of IEA examples
  - The elaboration of factsheets for practical examples
  - Overview of „Best Practices“ and „bad examples“

### 3. Step: Selection of case studies

**HELCOM**

Baltic Sea

**OSPAR**

North-East Atlantic

**REGNS**

North Sea

**UK Charting Process**

UK

**Eastern Scotian Shelf Integrated Management (ESSIM)**

Canada

**Puget Sound Partnership**

USA

**Chesapeake Bay**

USA

Australia

**Great Barrier Reef**

**Indonesia**

Indonesia

**Ocean Health Index**

Global

**ERAEF**

Australia

**ASSETS**

USA

## Factsheet

### Factsheet

### Evaluation

**Relevance**

**Transparency**

**Accessibility**

**Transferability**

->

**Overview  
table of  
Factsheets  
(all used  
indicators,  
parameters,  
monitoring  
systems)**

## Key elements of an IEA

- ▶ Indicators
- ▶ Human pressure indicators
- ▶ Socio-economic indicators
- ▶ Fisheries impacts
- ▶ MSFD descriptors
- ▶ Integration / Overall status
- ▶ And: Cumulative effects, future trends, risk analysis, treatment of uncertainty, transparency of methods, scientific rigour, stakeholder involvement

**Charting Progress 2:  
The State of the UK Seas**

# UK Charting Progress

- ▶ **Name:** Charting Progress 2
- ▶ **Type of assessment and level of integration:**  
Integrative approach
- ▶ **Assessment framework:** DPSIR
- ▶ **Developed by:** UK Marine Monitoring and Assessment Strategy (UKMMAS) community
- ▶ **Relation to other assessments:** OSPAR

## Charting Progress 2

The state of UK seas

# UK Charting Progress

## Strength

- Inclusion of a broad range of anthropogenic pressures and socio-economic indicators
- All MSFD descriptors covered
- builds on a broad evidence base (extensive monitoring programmes)
- Results easily accessible and presented in maps with regional focus
- Stakeholder inclusion

## Weakness

- No complete picture of the environmental status / an overall integrated status is missing
- No cumulative effects

# State of the Sound 2009

# Puget Sound

- ▶ **Name:** Puget Sound Integrated Ecosystem Assessment
- ▶ **Type of assessment and level of integration:**  
Integrative approach
- ▶ **Assessment framework:** Based on Levin's et al. (2009)  
5-step method
- ▶ **Developed by:** NOAA's Ecosystem Science Program in  
collaboration with Puget Sound Partnership (PSP)
- ▶ **Relation to other assessments:** The same approach is  
an example for other regions in the US (e.g. California  
Current, Massachusetts Bay)

## Condensed Factsheet Puget Sound

- „Experimental ground“ für IEAs in the US: „If something works here, it will be expanded to other areas“ (Levin, 2011)

### •Strength

- Integration of stakeholders and management authorities from the very beginning (indicator selection)
- Structured yet flexible framework to select indicators (explicitly linked to societal goals)
- Clear communication of its methodology (PS Science Update)
- Easily understandable presentation of results to the public through a “dashboard“ of indicators
- Inclusion of land use and its effects on the marine environment to a large degree

### •Weakness

- No real integration of overall status
- No use of status categories for the results
- No cumulative effects
- Indicators not fully developed (human well-being indicators still not identified)
- Results of the assessment have not led to changes in management strategies

An aerial photograph of the Great Barrier Reef, showing a vast expanse of shallow, turquoise water with numerous coral reefs and islands. The water transitions from a light blue near the shore to a deeper blue further out. The coral reefs appear as darker, textured patches of varying sizes and shapes scattered across the shallow water. The overall scene is a stunning natural landscape.

# Great Barrier Reef Outlook Report 2009

# Great Barrier Reef

- ▶ **Name :** Great Barrier Reef Outlook Report 2009
- ▶ **Type of assessment and level of integration:**  
fully integrated
- ▶ **Assessment :** decisions by a small task-force based on scientific data available; pressures and actual responses; forecast
- ▶ **Developed by:**  
Government of Australia, Great Barrier Reef Marine Park Authority
- ▶ **Relation to other assessments:** none

**Australian Government**

**Great Barrier Reef  
Marine Park Authority**

## Great Barrier Reef

### Strength

- Most developed assessment in the world; valuable features for the MSFD
- Draws clear conclusions on the status of various components (use of existing evidence if lack of data)
- A great deal of monitoring and scientific data already available
- Traditional knowledge and stakeholder inclusion

### Weakness

- Lack of transparency when small task-force takes decisions
- No clear management plan for monitoring and reporting

### 3.6.2 Chemical processes

| Assessment component      | Summary  | Assessment Grade |      |      |           |
|---------------------------|--|------------------|------|------|-----------|
|                           |  | Very good        | Good | Poor | Very poor |
| Nutrient cycling          | Exposure to nutrients has increased for much of the Great Barrier Reef especially in inshore areas.  |                  |      | ○    |           |
| Pesticide accumulation    | There are traces of pesticides in the Great Barrier Reef environment, the impacts of which are largely unknown.  |                  |      | ?    |           |
| Ocean acidity             | The world's oceans are becoming more acidic affecting the growth of corals.  |                  | ●    |      |           |
| Ocean salinity            | The salinity of Great Barrier Reef waters is generally stable, with local short-term fluctuations after flood events, mostly close to the coast.   | ●                |      |      |           |
| <b>Chemical processes</b> | For much of the Great Barrier Reef, the chemical environment has deteriorated significantly, especially inshore close to developed areas. This trend is expected to continue. Acidification of all Great Barrier Reef waters as a result of increased concentrations of atmospheric carbon dioxide is an emerging serious issue which is likely to worsen in the future. |                  |      | ○    |           |

|                           |   |   |
|---------------------------|---|---|
| <b>GRADING STATEMENTS</b> | <p><b>Very good</b> - There is no evidence of significant changes in chemical processes.</p>  | ↑ |
|                           | <p><b>Good</b> - Some chemical processes have changed in some areas, but not to the extent that the changes are significantly affecting ecosystem function.</p>               | ↑ |
|                           | <p><b>Poor</b> - Chemical processes have changed substantially in some areas to the extent that ecosystem function is significantly affected in some parts of the Region.</p> | ↑ |
|                           | <p><b>Very poor</b> - Chemical processes have changed substantially and over a wide area. Ecosystem function is seriously affected in much of the Region.</p>                 | ↑ |

## Best practice examples (in relation to key elements)

- ▶ Indicators: -ESSIM/UK
- ▶ Human pressures: Pudget Sound
- ▶ Socio-economic indicators: ESSIM, Great Barrier Reef (Climate change; Coastal development; Catchment runoff; and Direct use)
- ▶ MSFD descriptors: UK, HELCOM
- ▶ Integration/Overall status: HELCOM, Chesapeake Bay, Assets, Great Barrier Reef, Ocean Health Index

## Key Element: Integration

Expert judgement  quantitative method

Examples:

- ▶ Great Barrier Reef (no use of indicators, weighting and integration in a holistic manner)
- ▶ Assets (combination of indices, five grades for each index, combination of individual classifications)
- ▶ Ocean Health Index (identified indicators are categorized into 10 goals; different weights of indicators determine its importance to each goal)

## Best practice examples (in relation to key elements)

- ▶ Risk analysis: ERAEF, Pudget Sound
- ▶ Transparency of methods used: OSPAR, Great Barrier Reef, HELCOM, Pudget Sound
- ▶ Stakeholders: Pudget Sound, Indonesia, Chesapeake Bay
- ▶ Management Measures: Chesapeake Bay

## Requirements for IA concepts

### ▶ Example: Indicators

- Make best use of indicators, monitoring programmes and expertise already in existence.
- Take resource restrictions and feasibility into consideration when selecting indicators.
- When developing new indicators, consult integrated approaches from other regions.
- Focus on strategic indicators which can act as a bellwether for underlying changes in the ecosystem.

## Some recommendations of the interviewees:

- Do not write long reports
- Use regional grown indicators/programmes and complement them
- Provide criteria for the selection of indicators
- Include indicators on fisheries
- Consider socio-economic indicators
- A single index can derange the whole assessment
- Present results „policy friendly“

## Stakeholder participation is key!

An underwater scene with a boat on the surface. The water is clear and blue, showing various marine life including fish, a shark, and a squid. The background shows a coastline with cliffs and a lighthouse.

**Thanks for your attention!**
