

Methods for measuring impacts of circular-economy transitions

Modelling/ex ante studies

Modelling and ex ante studies aim to predict future developments.

Ex-post methods: studies, statistics and indicators

Ex-post statistics capture past changes and ex post studies can provide explanations.

Case studies

Case studies look closely at specific sectors, issues and processes.

By simulating major economic processes, models provide a way to explore the potential of circular-economy transitions.

Models are resource intensive. Outcomes can be uncertain, especially if fundamental sys-

temic change is involved and whenever results are highly

dependent on assumptions.

Ex-post methods are based on factual evidence and benefit from hindsight regarding complex causal effects.

 $\boxtimes \bigcirc$

Ex-post results cannot alter the outcome of the analysed event. Establishing causality amongst different factors can still be difficult or data may not even be available.

Case studies offer a high degree of detail and can take into account contextual differences.

Results are often not widely applicable as a result of the specificities of the case.
